EARTHQUAKES OF THE EARTH AND THEIR CAUSES

STUDY AND RESEARCH OF EARTHQUAKES OF THE PACIFIC COAST OF THE AMERICAS

(Copyright 1950 by Ralph L. Huber Laboratories)

It is possible to predict a high percentage of the major earthquakes of the world by a service by predicting periods of vulnerability to the conditions that cause true earthquakes and volcanic eruptions.

Most of our fears of earthquakes are due to our lack of a complete understanding of earthquakes and their causes. Earthquake vibrations are merely the elastic vibrations in the crust of the earth, traveling from the focus of the earthquake. The vibrations in themselves are not cataclysmic, but if you happen to be unfortunate enough, at the time of the vibrations, to be in a poorly constructed building, or worse than that, if you attempt to rush out of a building while loose bricks and debris are falling, you are apt to be hurt.

Earthquakes in the past have been of great value to life, in fact life on the land areas of the earth owes its very existence to those earthquakes. If the earth had not experienced those early earthquakes, the land would have remained perfectly smooth and flat mostly covered by water. All chemicals valuable to life would have remained hidden deeply in the crust of the land in various deposits. Earthquakes caused fracture and upturns of the various parts of the crust which gave rise to our mountains with the exposure of the useful elements necessary to life. From these mountains came the streams that carried the chemical riches to the valleys which made the valleys fertile. Without earthquakes and the exposure of the metals to the future use of man, there would have been no inventions such as: electric lights, automobiles, trains, ships, radios, telephones, nails in your shoes, fillings in your teeth and countless other things made of metal. Many of the elements found their way to the surface of the molten basaltic sphere by volitilization and gaseous chemical combinations vapors. The areas covered by the continental crust trapped the chemicals prior to the surface. Condensation of the elements in other areas became the salts of the ocean.
